TAKAB ETTESAL Company is a leading manufacturer of polyethylene pipe and fittings for water and gas services, this company was established on 1994 in Tehran-Iran with capacity around 3700MT/Year.

TAKAB ETTESAL Company will be able to produce a wide range of injection fittings in a same time due to having 21 lines which are made up in German.

This company is supply lots of products as follow:

- Electrofusion Fittings
- Injection Moulded Fittings
- Flanged Joint Fittings
- Special Fittings (according to customer request and standard requirement)

This Company with having 4 machines in CINCINNATI brand is able to produce mono and double layer polyethylene pipe up to size 630mm.

CERTIFICATES

Laboratory Accreditation:

The Takab Ettesal lab operates in accordance to the standard ISO/IEC 17025:2005 and is accredited from NACI- Iranian accreditation body with accreditation number NACI/Lab/357. The accreditation certifies technical qualification of the laboratory relatively to the testing detailed in the enclosed sheets to the certificate. Available at the website www.naci.ir.

Quality system certification:

The Takab Ettesal quality management system involves and manages all activities within the company in order to achieve the optimum level of the quality standards. That is on the basis of the direction imposed in the ISO 9001:2015 standard which points out the requirements for the supplier to show its capability in checking the processes which determine the conformity of the finished product. The correct management of all documents allows the tracing of the product through the batch reference number or other codes assigned during the production.

Quality product:

Takab Ettesal is authorized to use the ACM and SGS quality marking with reference to the standard ISO 4427-3 for the fittings as detailed in certificates.

Quality Control & Laboratory:

Takab Ettesal fittings are continuously monitored throughout the entire production process in accordance with the internal testing programs in compliance with the standards EN 1555, EN 12201, ISO 4424 and INSO 14427. The testing activities are continuously carried out following up the complete observance of the reference standards and foresee tests of mechanical and physical type, either on the fittings and on the raw material.

Particularly, the production is subjected to the following tests:

- **Melt mass-flow rate (MFR)**

Ref. ISO 1133-1, 2

- **Carbon Black Content**

Ref. ISO 6964

- **Hydrostatic Strength at 20°C and 80°C**

Ref. ISO 1187

- **Oxidation Induction Time (OIT)**

Ref. ISO 11357-6

- **Tensile Standards**

Ref. ISO 13953

ISO 6259

INSO 17140

- **Density**

Ref. ISO 1183

- **Carbon Black Dispersion**

Ref. ISO 18553

- **Decohesive resistance (peel and crushing test)**

Ref. ISO 13954

ISO 13955

ISO 13956

- **Dimensional Control, Marking control**

Ref. EN 1555

EN 12201

ISO 4427

INSO 14427

- **Tensile Creep Test Standards**

Ref. EN 12814

ISO 16770

a The minimum wall thickness has been set as e = 1.8 mm.

b The masses have been calculated taking an average density of 0.910 g/cm³. For other densities, the masses shall be corrected proportionally. Half the specified tolerance has been added to the wall thickness. The values have been rounded to 3 decimal places.

Electrofusion Welding Machine Specification

Technical Data of electrofusion welding machine HST300 Print+2.0

- Welding PE, PP pipe and fittings
size: 20mm – 1200 mm

Automatic data logging	10,000 reports	Miscellaneous	intuitive report review menu incl. search, ViewWeld feature, memory backup, AutoWeld feature, buzzer volume set point, measurement unit selection (inches/mm, °F/°C)
Welding range	Up to pipe & fittings size 1200mm	Languages	EN, DE, FR, BG, CS, ZH, NL, FI, GR, IT, NO, RO, SK, TR, RU,...
Data input	Barcode scanner, optionally scanning pen; manual input of fitting code sequence or welding voltage and time; optionally Fusamatic welding; all inputs also possible with novel GT keyboard	Production Standards and Approvals	CE, DVS, WEEE Reg. No. DE74849106, ISO 9001:2008, RoHS compliance
Welding monitoring system	Welding voltage, resistance, welding current, established contact, short-circuit, ambient temperature, input frequency, input voltage, memory control, welding unit temperature, maintenance interval	Operation standards	EN1555, EN12201, ISO4427, INSO14427, IGS-M-PL 016(2), ISIRI11233
System self-monitoring	System check, computerized maintenance management, incl. recording	Output voltage	8 V - 48 V
Traceability pursuant to ISO 12176-2/4	Commission number 32 alphanumeric characters, ISO compliant welder ID code, additional data 20 and 15 alphanumeric characters, ISO-compliant pipe data, fitting data, pipe length, weather conditions, installing company, joint number, inventory number, info on servicing company	Output current	Max. 110 A
Data output with menu	USB interface (USB A) for data download as an abstract or extended report in the PDF format to a USB stick or a label tag printer, with tag print menu;	Input voltage	180 V - 280 V
Display screen	Robust, hi-res temperature range-extended screen, character size 8 mm	Input frequency	40 Hz - 70 Hz
Weight	16 kg	Current consumption	AC 16 A
Dimensions	W 236 x H 295 x D 330 mm	Power rating	3500 W
Adapter	4.0 mm in adapter bag	Recommended generator power	3.5 kVA
		Temperature range	-20°C through +60°C
		Power cord	5 m
		Welding cable	4 m with 4.7 mm connection terminal
		Automatic temperature compensation	Yes
		Ingress protection	IP54
		warranty	12 months

1- Electrofusion welding

1-Measure area which has to be scraped with marker.

2- Scrape at last 0.2 mm of outside pipe surface to remove oxidation and other contaminants.

3- Clean pipe scraped area.
Note: do not touch the scraped area with bare hands after scraping and cleaning.

4-Insert pipe into electrofusion coupler.

5-Place second pipe end up to first pipe push electrofusion coupler back onto the second pipe until the second marking area with bare hands after scraping and cleaning.

6- Read barcode by scanner or light pen

2- Butt fusion welding

1. Place the pipes or fittings in the clamps .

2. Check alignment .

3. Place facing tool and start to cut surface of both pipes or fittings end .

4. Place heater plate and apply pressure determined until a uniform bead formed on each end .

5. remove heater plate , close clamps to bring bead up .

3- Flanged Joint

Type (A)

Flange with steel Backing Ring

Type (B)

Steel Core Hole Flange

Advantage of Steel Core Hole Flange:

- 1- High Strength in comparing with backing ring due to using special material
- 2- No need to galvanized backing ring due to coating with polyethylene
- 3- Using shorter bolts in comparing with butt fusion polyethylene flange
- 4- Easy performance projects due to weigh less and reduction implementation time
- 5- Reduction of project cost

Welding techniques:

1 - But Welding

Butt-fusion jointing is a thermo-fusion process which involves the simultaneous heating of the ends of two Components which are to be joined until a melt state is attained on each contact surface. The two surfaces are then brought together under controlled pressure for a specific cooling time and homogeneous fusion is formed upon cooling. The resultant joint is resistant to end thrust and has comparable performance under pressure to the pipe.

This method of jointing requires an electrically heated plate to raise the temperature of the pipe ends to the required fusion temperature and is used for PE 80 and PE 100 grades of material for pipe of size 32 mm and above of the same Standard Dimension Ratio (SDR).

Remarks:

1) Dissimilar materials and dissimilar wall thicknesses can be joined by electrofusion. (Please note that the maximum working pressure should not exceed the lower of the two pipes.)

2) Similar material and/or wall thickness may be joined by Butt fusion or electrofusion. (Please note that SDR17 can be butt fused To SDR17.6)

3) Dissimilar wall thickness must not be joined by butt fusion.

2- Electrofusion welding

The sectional drawings show the jointing sequence from energizing the coil until completion of fusion. The whole cycle is electronically monitored by the electrofusion control unit (ECU).

1. Pipe positioned in coupler prior to energising coil.

2. Coil energised.

3. Material surrounding coil starts to melt.

4. Area of melt extends leading to expansion towards pipe surface.

5. Heat transfers to pipe wall and material starts to melt

6. Melt solidifies at the start of the cold zones, thereby sealing the melt zone. Further input of energy causes increase in melt pressure.

7. Melt pressure reaches optimum value at end of energising cycle. Emergence of the melt at the indicator holes shows that fusion is complete.

The material polyethylene (PE)

General

Polymers which consist only of carbon and hydrogen (hydrocarbons) are called polyolefin. Polyethylene (PE) belongs to this group. It is a semi crystalline thermoplastic. Polyethylene is the best known standard polymer.

The chemical formula is: $(CH_2-CH_2)_n$. It is an environmentally friendly hydrocarbon product.

PE and PP belong to the non-polar materials. Because of this, the material does not dissolve in common solvents and, in addition, hardly swells. As a result, PE pipes cannot be solvent cemented. The appropriate jointing method for this material is welding. For piping installations we offer two welding techniques in our product range: butt fusion and electrofusion.

The latter jointing technique is preferred for piping systems transporting gas, water, compressed air or other less aggressive media. Butt welding are preferably used on a diameter-specific basis. High molecular PE grades of medium to high density have become state of the art for industrial piping installations.

The Stress Regression Line

Numerous actual test results, measured at 20°C and 60°C, over a range of times up to 10,000 hours, are plotted on a log scale and a regression line is calculated to fit this data. The resultant regression line is then extrapolated to 50 years (438,000 hours). The method of calculation is an internationally accepted procedure described in ISO/TR 9080. The required values of stress and time are specified in ISO 4427.

The internationally accepted method for calculating circumferential hoop stress is derived from Barlow's formula and is as follows:

$$\sigma = p (d - e)/2e$$

where:

p = internal pressure (MPa)

e = minimum wall thickness (mm)

d = mean external diameter (mm)

σ = circumferential hoop stress in wall of pipe (MPa)

The Stress Regression Line for HDPE is given below.

Figure 3: Long-term hydrostatic pressure resistance of pipes made from PE 100

INTRODUCTION OF PLASTICS

+ = Specimen is resistant swelling <3% or alternatively weight loss <0.5%, elongation of break not significantly changed

Thermal properties

Polyethylene pipes can be used at temperatures ranging from $-50\text{ }^{\circ}\text{C}$ to $+60\text{ }^{\circ}\text{C}$. Like all thermoplastics, PE shows a higher thermal expansion than metal. Our PE has a coefficient of linear thermal expansion of 0.15 to 0.20 mm/m K.

Electrical properties

Because of the low water absorption of PE, its electrical properties are hardly affected by continuous water contact. Since PE is a non-polar hydrocarbon polymer, it is an outstanding insulator. These properties, however, can be worsened considerably as a result of pollution, effects of oxidizing media or weathering. The specific volume resistance is $>10^{17}\ \Omega\text{cm}$; the dielectric strength is 220 kV/mm.

Installation

The trench

al and regional regulations and directives for soil covered pipelines are to be followed during the construction of the necessary trench. The trench has to allow all parts of the pipeline to be in a frost-safe depth.

The base of the trench has to enable the pipeline to bear on smoothly. In case of bedrock the trench has to be excavated deeper and filled to the desired depth with appropriate material which grain size does not damage the pipe.

The crucial factor to attain a good load capacity of pipes and fittings underground is a correct construction of the area around the pipe. The correct design of the pipe zone is determining the load capacity of PE pipes and fittings.

The pipe zone consists from bedding side fill and cover depth.

Usually, the minimum bedding is according to EN1610 $a = 100\text{mm}$, in case of bedrock or compacted

underground $a = 150\text{mm}$. Further, there are demands concerning the filling material. Materials with elements bigger than:

- 22 mm at $\text{DN} \leq 200$
- 40 mm at $\text{DN} > 200$ until $\text{DN} \leq 600$

should not be used.

The upper bedding layer b is assessed from static calculations.

It is important to assure no cavities below the pipe. The bedding dissipates all loads from the pipe evenly into the ground. For this reason the PE pipe has to lay evenly on the bedding over its complete length.

The upper end of the pipe zone is defined according to EN 1610 as 150mm above the pipe apex respectively 100mm above the pipe connection.

Long-term behavior of thermoplastic material

The most important characteristic of pressurized plastics is the pressure-time-behavior. This means the empirical and calculated life-time of pipes and parts of piping systems under depending boundary conditions such as inner pressure, temperature and time.

Calculation of allowed pressure/wall thickness

The technical design of pressurized thermoplastic pipes is carried out strictly according to strength requirements by means of the kesselformula. All pipe dimensions in standards are based on this formula. Deviations are just possible in smaller diameters since certain wall thicknesses will not under-run be due to practical and production limitations.

$$e = \frac{P \cdot d}{20 \cdot \sigma_{zul} + P}$$

Using:

e: wall thickness in mm

d: outer pipe diameter in mm

p: allowable pressure in bar

σ_{zul} : allowable stress in N/mm²

Simply using the nominal pressure is not enough anymore. The usual deployment of PN as a measure for the pipe size can harbour a danger of confusion regarding butt fusion. Plastic pipes and fittings equally pressure tolerable are meanwhile marked pressure-neutrally. The goal is to prevent a misuse of pipes in different application areas or different conditions. According to ISO 4065 pipes are classified into series. The series determines the load resistance without possibility of confusion as the nominal pressure did.

The pipe series is marked by the letter S. This series is based on the following formula:

$$S = \frac{10 \cdot \sigma_{zul}}{P \cdot C} = \frac{d - e}{2 \cdot e}$$

Consequently, S is dimensionless. For an PE-pipe with the dimensions 110 × 10 mm the formula yields $S = 5 = (110 - 10) / (2 \cdot 10)$.

Further the denotation SDR is known. SDR stands for Standard Dimension Ratio. SDR indicates the diameter/wall-thickness-ratio.

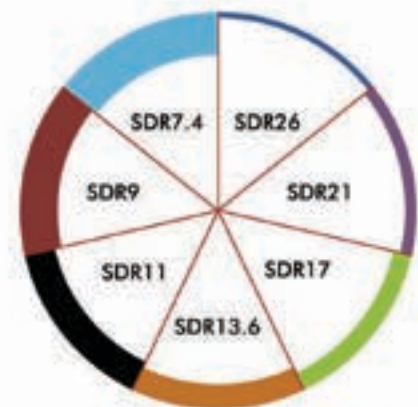

$$SDR = \frac{d}{e}$$

Series- and SDR are connected through the following formula:

$$SDR = 2 \times S + 1 \text{ or } S = (SDR - 1) / 2.$$

Using the upper example:

$$SDR = \frac{110}{10} = 11 = 2 \times 5 + 1$$

Currently all three indicators PN, S and SDR are used in the market. Takab Ettesal recommends to always stating dimension, wall-thickness and pipe series or SDR.

SDR	Pipe series S	Nominal Pressure PN
$\text{SDR} = \frac{d}{e} = 2.5 + 1$	$S = \frac{d - e}{2e}$	$PN = \frac{10 \sigma_s}{S}$
e.g.: SDR of $110/10 = 11$	$S = \frac{100 - 10}{2 \times 10} = 5$	$PN = \frac{20 \sigma_s}{\text{SDR} - 1}$ $\sigma_s = \text{Designed stress}$

Required pipe diameter What size should the pipe be? Formulas

The following formula can be used for a first approximation of the pipe size required for a given flow rate:

$$d_i = 18.8 \sqrt{\frac{Q_1}{V}} \quad \text{OR} \quad d_i = 35.7 \sqrt{\frac{Q_2}{V}}$$

where:

- v flow velocity in m/s
- di inside pipe diameter in mm
- Q1 flow rate in m³/h
- Q2 flow rate in l/s
- 18.8 conversion factor for units
- 35.7 conversion factor for units

The flow velocity must first be approximated according to the intended use of the pipeline. Standard values for the flow velocity are:

Liquids

- v = 0.5-1.0 m/s for suction
- v = 1.0-3.0 m/s for delivery

Gases

- v = 10-30 m/s

The calculations of pipe diameter have not taken into account hydraulic losses. These require special calculations for which we offer the following information and recommendations.

Wall thicknesses and their tolerances

Dimensions in millimeter

Nominal Size DN/OD	Pipe Series

^a PN values are based on C=1,25

^b Tolerance in accordance with ISO 11922-1:1997, grade V, calculated from (1,5 e_{nom} + 0,1) mm rounded up to the next 0,1 mm, for certain applications for e > 30mm, ISO 11922-1:1997, grade T, tolerance may be used calculated from 0,15 e_{nom} rounded up to the next 0,1 mm.

^c The calculated value of e_{nom} according to ISO 4065 is rounded up to the nearest value of the either 2,0, 2,3 or 3,0. This is to satisfy certain national requirements. For practical reasons, a wall thickness of 3,0 is recommended for electrofusion jointing and lining application.

According to standard EN 12201
ISO 4427
INSO 14427

Physical characteristics of pipes

Characteristic	Requirements	Test parameters		Test method
Melt mass-flow rate (MFR)	When processing the material into a pipe, the MFR-value specified by the raw material producer may deviate at maximum $\pm 30\%$ compared with the raw material	Test temperature	230 °C	ISO 1133-1
		Loading mass or ^a	2,16 kg	
		Test temperature	190°C	
		Loading mass	5 kg	
Thermal stability tested by resistance to internal pressure at 110 °C	No failure during the test period	Material	Hydro static (hoop) stress MPa	ISO 1167-1 ISO 1167-2
		PP-R	1,9	
Longitudinal reversion	$\leq 2\%$	Temperature	135 °C	ISO 2505 Method B: Air oven
		PP-R		
		Immersion time:	1 h	
		$e \leq 8\text{ mm}$	2 h	
		$8\text{ mm} < e \leq 16\text{ mm}$	200 mm	
		Length of test pieces		
^a Alternative test method. In case of dispute, the test method agreed in the customer product specification with the raw material producer shall be used.				

Physical characteristics of fittings

Characteristic	Requirements	Test parameters		Test method
Melt mass-flow rate (MFR)	Change of MFR by processing $\pm 30\%$	Test temperature	230 °C	ISO 1133-1
		Loading mass or ^a	2,16 kg	
Test temperature	190 °C			
Loading mass	5 kg			
^a Alternative test method. In case of dispute, the test method agreed in the customer product specification with the raw material producer shall be used.
